

ABSTRACT

A method for handling messages between wireless devices in a network, includes:
receiving a message for a device application by a dispatcher application on a receiving
wireless device; determining that the device application does not exist on the receiving
5 wireless device by the dispatcher application; and sending a notification to a user of the
receiving wireless device of receipt of the message. Because the dispatcher application on
the receiving wireless device sends this notification, the developer of the device application
has an opportunity to sell the device application to the user, and the user has the opportunity
to purchase the device application.
